

HEATING & COOLING System

Air conditioning and heating units are important systems in our living spaces as they create a comfortable indoor environment for you and your family. Having regular AC maintenance tune-ups will keep these units in tip-top condition.

1 High Energy Bills

A drastic increase in energy bills may signify a faulty air conditioning and heating system. Dirty and clogged ductwork force the HVAC system's motor to work harder while pumping clean air and a faulty furnace may consume more energy.

If you discover a surge in your electrical bills in Texas, call Infinity Texas Air for AC repair services.

2 Weird Noises

Of course, it is not unusual for air conditioning and heating systems to produce some noise when running because they are mechanical systems. However, you may start to hear some weird noises such as banging, clanking, or screeching coming from your air conditioning and heating unit. If so, you should seek AC service immediately.

3 Bad Smells

Clean air coming from the vents should be crisp and fresh, but if you discover a strange odor coming from the vents, then most likely, something is wrong with your air conditioning and heating system.

4 Infinity Texas Air - the Perfect AC Maintenance and Repair Partner
